

It is finally here!

The ability to blend two round bales in any desired ratio

BLENDING lower quality cheaper roughage with higher quality roughage dramatically lowers feed cost and the cattle do better on a balanced ration.

Patented

Blending and Feeding Roughages

Getting the same blend of roughage in front of every cow is crucial for feeding efficiency. No more situations where the strong cows get all the good stuff and the weaker cows get all the filler. No more feeding the good stuff one day and the filler the next day which causes constant readjusting of the microbes in the ruminant. The really great news is that with the EZ Ration Processor you can feed less total tonnage, you can feed a higher percentage of filler. In most cases the feed cost savings will be between 20% to 50%, and can be even more. You can also feed in less time, with less labor and machinery, and the cattle will do a lot better on the balanced ration.

Blend Two Bales and Carry a Third Bale

The round bale EZ Ration Processor was designed to blend two bales and carry a third bale. This allows the producer to blend one higher quality bale with two lower quality bales. When feeding a balanced, cost efficient ration, quite often you end up blending one bale of the high quality roughage with two bales of the lower quality filler roughage.—

However, the EZ Ration Processor's patented ability to run the floors independently and at different speeds allows the roughage to be blended in any desired ratio for maximum feeding efficiency. The ratio can also be changed on the go to feed different classes of livestock.

Tractor Requirements

A thousand speed PTO is required. A minimum of a 100 to 120 horse power tractor is recommended. 16 gpm hydraulic out put is required. One set of hydraulic hose quick attach is needed to run the floor chains on the processor and another set is required to run the optional grapple. The total empty weight of the unit (including the option grapple) is approximately 9000 pounds.

Grapple Remote Joystick Controller

One of the really cool features of the optional self loading grapple is the Joystick controller which you can operate from the cab of the tractor—you can operate 4 functions by moving the joystick up-down-right-left—pull the trigger and those same motions operate 4 more functions—the rocker button on the top of the joystick opens and closes the grapple.

EZ RATION ROUND BALE PROCESSOR

The Grapple Option

Load the EZ Ration Processor from the comfort of the tractor seat utilizing the grapple's remote controls. The grapple also eliminates the need to scatter out your round bales so you can load them later. Now producers can stack their bales and load them directly off of the stack, this can further reduce hay loss.
